### Field of interest

The main goal of my lab is to understand how *Plasmodium*, the causative agent of malaria, survives the dry season when no mosquitoes are available. *Plasmodium* usually alternates between a human host and a mosquito vector, but in many areas of the globe a long and complete dry season interrupts transmission for several months. We study the host and parasite factors that contribute to silent carriage of parasites in ~20% of children during the 6-month dry season in Mali, and how transmission resumes in the ensuing wet season when mosquitoes return.
